

CLIMATE CHANGE IMPACTS ON SOUTH CAROLINA

WHAT IS CLIMATE CHANGE?

The earth's climate is changing because of excess carbon dioxide pollution in the atmosphere, generated when fossil fuels like coal, oil, and natural gas are burned. This extra carbon traps more heat, like a greenhouse, which explains why 2000 to 2009 was the hottest decade ever recorded and there have been over 400 consecutive months with hotter-than-average global temperatures. Modern civilization developed in a stable climate and we have built our economy and way of life accordingly. Changes to our climate means that we are facing emerging hardships and vulnerabilities as the impacts of climate change unfold.

Some impacts from climate change include extreme storms, flooding from sea level rise, heat waves, and drought. These impacts have consequences for public health, safety, the economy, the environment, and our way of life.

Fortunately, we can protect against the worst impacts by limiting carbon pollution with energy efficiency and using clean renewable energy, like solar and wind.

Over the last decade, SC coal-fired power plants emitted an average of 32 million metric tons of carbon pollution each year.

South Carolina's most treasured landscapes, such as our salt marshes, and all the pastimes they support—boating, fishing, shrimping—are threatened by climate change.

HOW DOES CLIMATE CHANGE IMPACT SC?

It is difficult to link any one event directly to climate change, and it is important to recognize that most climate data is regional or even global in scope. However, decades of expert research and centuries of historical records can be compared with recent trends to illustrate how climate change is already impacting parts of the Southeastern United States. These impacts, combined with possible future impacts, are both cause for concern and the imperative for action.

- Some of South Carolina's most **treasured places** are flooding and eroding away due in part to sea level rise from climate change. Seas are [projected](#) to rise by 1 to 4 feet, but as much as 8 feet, throughout the 21st century alone, compromising places like the historic Charleston peninsula, and our many beach communities. Sea level rise also [jeopardizes South Carolina's coastal tourism economy](#) that generates \$8 billion and supports 82,000 jobs annually. [Several studies](#) have shown that property values are being eroded by coastal properties' flooding vulnerability.
- **Heritage foods** of South Carolina are suffering because of carbon pollution and climate change. Some seafood, such as [oysters and scallops](#), are directly harmed by the carbon pollution absorbed into the ocean, while some farmers are losing crops to [unreliable winter weather](#), and [late spring freezes](#), which are expected to increase, along with [heat and drought stress](#), in a warmer world. For example, [twice in the past decade](#), 90% of the state's peach crop has been wiped out by cold snaps—in 2007 and 2017—with over \$1 billion in damages, and in years to come, unseasonably warm winter weather may [prevent peach, apple, pecan and other fruit and nut trees](#) from producing.
- **Hurricanes** are getting [more intense](#) in a warmer world, tending toward heavier rain and more category 4 and 5 storms. Coupled with flooding from sea level rise, the liability to our coastal communities is great. Insurance will likely continue to get more expensive as more extreme weather disasters take place.

IT'S TIME FOR SOLUTIONS!

PROMOTE CLEAN ENERGY

Clean energy, such as solar, wind, and energy efficiency, produces no pollution and provides jobs to our economy. Studies show that the United States could easily generate 80% of its power from clean sources by 2050. Energy efficiency can dramatically reduce the amount of power we use in our homes and businesses and lower our bills. Wind and solar energy are now the least expensive forms of new electricity in the country and South Carolina has abundant resources of each. Electric vehicles are now widely available and reduce our reliance on oil. Our state policies should seek to level the playing field between clean energy and riskier fossil power plants.

OPPOSE HIGH RISK ENERGY

Some energy sources have greater risks associated with their use. Old, inefficient and dirty coal power plants must be retired to reduce levels of pollution that trigger asthma attacks and heart and lung disease, put mercury in our water, and cause climate change. Nuclear power plants emit less carbon than coal but are extremely expensive to build, require large amounts of water to operate, generate dangerous, highly radioactive waste and can have devastating consequences should an accident occur. Our coast is too precious to be compromised by spills from offshore drilling. Clean energy is a positive alternative to each of these risky energy sources.

TAKE ACTION TODAY!

Find & Contact Your Elected Officials

www.bit.ly/legislator-search

Support Our Work & Become a
Member of SACE Today

www.cleanenergy.org/donate

Join the Southeast Coastal
Climate Network

www.cleanenergy.org/seccn

CONTACT YOUR ELECTED OFFICIALS

National and state-level climate and energy policies are imperative to ensure protection from the worst impacts of climate change and to secure the benefits of clean energy. Contact your elected officials in Washington D.C. and Columbia and tell them we must have climate and energy policies that:

- Invest in job-creating energy efficiency and clean energy
- Limit carbon pollution
- Preserve and strengthen the Clean Air Act
- Hold polluters accountable and end fossil-fuel subsidies
